

DiaBite

Can I eat this?

People with type 2 diabetes face that question five to seven times a day. DiaBite answers it from a plain sentence, with every number computed and checked rather than generated. It runs on Azure AI Foundry for adults with type 2 diabetes and prediabetes in the US, and is being prepared for its first five users.

Nadia Babich, founder · AI product pitch · October 2026

THE PROBLEM

One question, asked all day.

“I’m about to eat this. Can I? How much? What do I eat it with?”

A food list cannot answer it. A calorie app can, at 3 to 5 minutes of work per meal.

Constant

Five to seven times a day: the aisle, the menu, the fridge at 11pm.

A meal, not a food

Glycemic impact belongs to the whole plate. A table cannot say that.

Laborious

Carb counting works, but means weighing, looking up and adding up.

Real life

A burrito bowl, a snack in the car. Meal plans break on most days.

Market impact. 40.1 million Americans have diabetes and 115.2 million adults have prediabetes. Diagnosed diabetes cost the country **\$412.9 billion** in 2022.

OUR SOLUTION

Three capabilities, one promise.

01

Understands your words

“A burrito bowl” becomes foods and portions. It asks one question when unsure and says when it does not know a food.

02

Computes, then checks

An engine over 6,054 foods and published glycemic-index tables. A verifier rejects any number no tool returned.

03

Proves itself

Automated evaluations on every change, and probes that try to get past the safety rules.

UNIQUE VALUE

Every number was computed, not generated.

The model reads the question and writes the sentence. It never produces a nutrition number.

DEMO RECORDING

DiaBite

Nutrition for type 2 diabetes and insulin resistance

This is a reference tool, not medical advice. The numbers come from published formulas and averaged glycemic-index values. They do not account for your therapy and must never be used to calculate insulin doses. Discuss any change to your diet with your clinician.

[Can I eat this?](#) [Diary](#) [Weekly menu](#) [Profile](#) [Feedback](#)

GLYCEMIC LOAD LEFT TODAY 48 of 48

What are you about to eat?

Say it the way you'd say it to a friend. The agent does the counting — and shows its arithmetic.

Burrito bowl with white rice, black beans, chicken and guacamole

Ask

Burrito bowl with white rice, black beans, chicken and guacamole

+ FITS WITH A CHANGE

This fits your day.

THIS MEAL	BEFORE	LEFT AFTER
41.2	48	6.8

What it shows

1. The daily budget is computed from your answers.
2. A real sentence becomes a receipt.
3. An unknown food is named as unknown.
4. A dose question is refused at once.
5. Next: a week of meals and its shopping list.

BUSINESS MODEL

Free to trust, paid to rely on.

Revenue streams

Free: the whole deterministic engine and 15 agent answers a month. Pro: unlimited answers, photo logging, adaptive re-planning, memory, export.

Pricing strategy

To test: \$14.99 a month or about \$112 a year, against tracking apps at \$60 to \$80 a year. The price comes from the sessions and the beta, not from a table.

Customer acquisition

Dietitians and clinicians, who refer patients and recommend apps, plus condition communities and search. Paid ads are ruled out by arithmetic.

Key metrics

At \$14.99, ten paying users cover the running costs and about 1,100 give €10,000 a month net. Measured: €0.0026 a question, p90 about 8 s.

Costs are measured. Growth, conversion and churn are assumptions: there are no users yet, and the plan says so.

THE TEAM

One builder, and clinicians checking the work.

Clinical review

PHYSICIANS AND DIETITIANS

Three physicians hold the review pack that lists every decision the product makes about a person. The first review changed the product within a day.

WHAT WE'VE LEARNED

Evaluation is the gate.

KEY INSIGHT

Test the product the way it fails.

The evaluations found nine defects, among them “two eggs” silently dropping out of a meal and arriving as a confident, wrong total.

KEY LEARNING

A rule beats a prompt. A physician found the kidney cap undone by a protein floor; an audit found 9 of 21 dangerous phrasings getting past the safety rules. Each is now a permanent test.

NEXT STEPS

Real users break things better. Five moderated sessions next; every phrase that breaks the product becomes a test case.

Speed came from structure, not a bigger model: a meal turn from four tool calls to two took the p90 from 26 s to under 9 s.

WHAT'S NEXT

From a demo to something used twice.

NOW

Five strangers, three clinicians

Five moderated 30-minute sessions on the hosted app. Clinician answers turn into code, a test or a documented decision.

NEXT

A week, planned for you

A weekly menu inside your daily budget, with the week's shopping list: built, waiting for clinical review. Then branded foods, to close the food gap.

THEN

A diary that stays

Accounts and history, with deletion on request and a clear statement of what is kept, before DiaBite holds health data.

Open to: clinicians who will take the logic apart · adults with type 2 diabetes or prediabetes for a 30-minute session · nutrition-data partners for branded foods.
